

1 Describe → audit storyboards — three UX structures, three levels of machinery, three gate treatments · plus the architecture diagram

1a Builder workspace — chat + live preview (Lovable-shaped). Machinery in an optional "under the hood" drawer. Gate = preflight checklist modal.

1b Pipeline — the 8-stage workflow IS the nav. Compliance meter always on. Most machinery shown. Gate = continuous checks, promote when green.

1c Clinical chart — borrows clinical ritual: order → draft → addendum → co-sign → release. Least machinery. Gate = a reviewer that co-signs, like attesting a note.

① **Write the order** — describe, framed as order entry

☐ New order — practice tools

Order: a tool that...

"checks each new patient's insurance before their first visit"

Protocol (evidence-based starting point):

☒ insurance verification ✓ ☐ patient intake

② **Draft** — preview watermarked like an unsigned note

☐ insurance checker DRAFT — test patients only

UNSIGNED DRAFT

③ **Addenda** — iterations logged like chart addenda

☐ insurance checker — history

addendum 3 · today 9:40 — "also check referral requirement" ✓

addendum 2 · today 9:12 — "front desk sees a pending queue" ✓

addendum 1 · yesterday — initial draft from protocol

④ **Co-sign** — the gate, as a reviewer that attests

☐ Co-sign & release

Compliance review
automated · 40s · attestation attached to record

✓ patient data encrypted ✓ access logged ✓ auto-logout
✓ no outside AI services ✓ tested on synthetic patients only

"Meets release criteria for a patient-facing tool. Two items to re-review if you later add messaging." — platform reviewer

Dr. A. Osei

⑤ **Released** — quiet operate view, no infra language

☐ insurance checker IN USE

Working normally. Used by 3 staff · 27 checks this week.

needs your attention 1 failed verification this week saved ~2.5 hrs

Something wrong? [describe it](#) — fixes go through review again.

⑥ **Access record** — audit as a familiar chart-access log

☐ insurance checker — access record

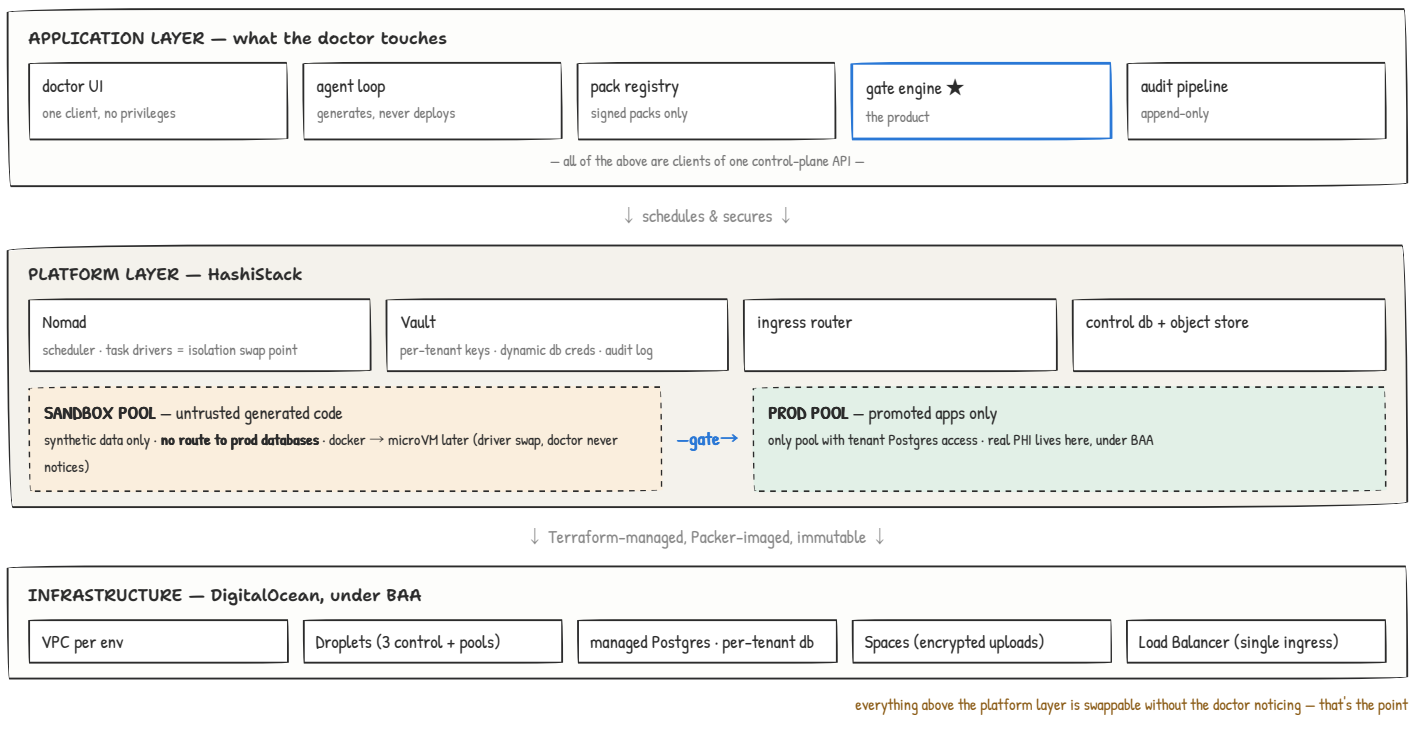

Every look at patient data is recorded — same idea as chart access logs.

10:02a · front desk (R. Kim) · viewed M. Diaz eligibility

9:48a · system · ran overnight verification batch

yest · you · released v3 (review attached)

1d Architecture diagram — the three layers + sandbox/prod split, sketch form for partner conversations.

Try next: "storyboard 1c's co-sign as a full-size screen" · "merge 1a's layout with 1b's continuous meter" · "wireframe the pack registry"
